

Wind. It means the world to us.™

Vestas is the only global energy company dedicated exclusively to wind energy. Wind is our business and our passion.

We are producing turbines since 1979 and have since gained a market-leading position with 77 GW of installed wind power and more than 63 GW under service globally.

In Technology and R&D - Drivetrain we are working on innovations for the components of the drivetrain. Reliability, Efficiency and the reduction of costs are driving us to investigate future technologies and new concepts as well as improvements on today's designs. We work on components such as gearboxes, bearings and couplings and investigate on noise and vibration, interpretation of measurements and simulations. This includes improvement on engineering processes and application of up-to-date tools.

You are currently a student of mechanical engineering, mathematics, statistics, mechatronics or similar and you are looking for...

...Internship, Bachelor thesis, Master thesis?

...the experience what it is like to work in a highly motivated and skilled team?

Work with Vestas on the drivetrain of wind power turbines!
